Capstone Project: SCARE (Scar Classification and Recognition Engine)

Deep Learning untuk Diagnosis Otomatis Bekas Luka Kulit (Hypertrophic vs Keloid Scars)

1. Latar Belakang (Problem Discovery) Bekas luka pada kulit akibat trauma, operasi, atau luka bakar seringkali menyembuh secara tidak normal, menghasilkan *Hypertrophic Scars* atau *Keloid Scars*. Secara klinis, kedua kondisi ini sangat mirip pada fase awal:

- **Hypertrophic Scars**: Tumbuh menebal namun **tetap berada dalam batas luka asli**, dan perlahan dapat memudar seiring waktu. Penanganannya cukup menggunakan terapi konservatif (silikon, tekanan).
- **Keloid Scars**: Tumbuh agresif **melampaui batas luka asli**, tidak bisa hilang dengan sendirinya, dan seringkali membutuhkan intervensi bedah atau injeksi kortikosteroid.

Permasalahan: Diagnosis yang salah (misalnya mengira Keloid sebagai Hypertrophic atau sebaliknya) berakibat fatal. Tindakan operasi pada Keloid justru berisiko memicu pertumbuhan jaringan parut yang jauh lebih besar.

Solusi yang Diusulkan: Proyek **SCARE** bertujuan membangun *Computer Vision system* berbasis *Deep Learning* yang mampu mengklasifikasikan gambar bekas luka secara *real-time* dengan akurasi tinggi. Sistem ini ditujukan untuk menjadi *second-opinion tool* bagi dokter umum di puskesmas atau aplikasi *telemedicine*, guna mencegah penanganan medis yang salah sejak dini.

TASK 2: Data Wrangling End-to-End

Gathering, Assessing, dan Cleaning Data

Pada tahap ini, kita memastikan bahwa data gambar yang masuk ke dalam model memiliki kualitas yang layak. Kualitas gambar yang buruk (sangat *blur* atau beresolusi terlampau kecil) akan merusak proses ekstraksi fitur oleh *Convolutional Neural Network* (CNN).

Langkah-langkah yang dilakukan:

1. **Gathering Data**: Mengambil gambar dari folder *dataset mentah* yang diklasifikasikan ke dalam 2 folder: `hypertrophic scars` dan `keloid scars`.
2. **Assessing & Cleaning (Blur Detection)**:
   - Menggunakan algoritma **Variance of Laplacian** via pustaka OpenCV.
   - Algoritma ini mendeteksi jumlah *edge* (tepi) pada sebuah gambar. Gambar yang tajam akan memiliki *variance* tinggi, sedangkan gambar *blur* memiliki *variance* rendah.
   - *Threshold* yang digunakan adalah `10.0`. Gambar dengan nilai di bawah *threshold* ini dianggap rusak/terlalu *blur* dan akan **dibuang** (diasingkan ke folder `dibuang_karena_blur`).
3. **Final Output**: Gambar yang lulus sensor kualitas akan disalin ke direktori `Dataset_Bersih` dan siap dianalisis pada tahap EDA.

TASK 3: Pertanyaan Bisnis

Proyek ini tidak hanya berfokus pada akurasi teknis, tetapi juga harus menjawab tiga metrik bisnis utama:

1. **Apakah model deep learning (dengan transfer learning) mampu mengklasifikasikan hypertrophic vs keloid scar dengan akurasi >= 85%?** *(Menentukan apakah sistem siap di-deploy secara klinis, atau membutuhkan pengumpulan data yang lebih masif).*
2. **Dari berbagai arsitektur CNN (VGG16, ResNet50, MobileNetV2, dll), arsitektur manakah yang memberikan keseimbangan terbaik antara *Accuracy*, *F1-Score*, dan komputasi yang ringan untuk aplikasi berbasis web?**
3. **Apakah terdapat perbedaan visual yang konsisten (dari segi kecerahan/brightness atau ketajaman) antara kedua kelas bekas luka pada dataset ini yang bisa dipahami secara kasat mata?**

In [4]:
```
questions = [
    "Q1: Apakah model deep learning mampu mengklasifikasikan hypertrophic vs keloid scar dengan akurasi >=85%?",
    "Q2: Arsitektur model mana yang memberikan performa terbaik?",
    "Q3: Fitur visual apa yang paling membedakan kedua jenis bekas luka?",
    "Q4: Apakah data augmentation signifikan meningkatkan performa model?",
    "Q5: Apakah model cukup reliable sebagai alat bantu diagnosis awal?",
]
for q in questions:
    print(f"  > {q}")

with open(str(METRICS_DIR / "business_questions.json"), "w", encoding="utf-8") as f:
    json.dump(questions, f, indent=2)
```

```
> Q1: Apakah model deep learning mampu mengklasifikasikan hypertrophic vs keloid scar dengan akurasi >=85%?
> Q2: Arsitektur model mana yang memberikan performa terbaik?
> Q3: Fitur visual apa yang paling membedakan kedua jenis bekas luka?
> Q4: Apakah data augmentation signifikan meningkatkan performa model?
> Q5: Apakah model cukup reliable sebagai alat bantu diagnosis awal?
```

TASK 4: Exploratory Data Analysis (EDA)

Tujuan dari tahapan ini adalah untuk memahami distribusi data, mendeteksi potensi bias (*imbalance*), serta menganalisis karakteristik intrinsik piksel (kecerahan dan resolusi) sebelum dimasukkan ke dalam model *Deep Learning*.

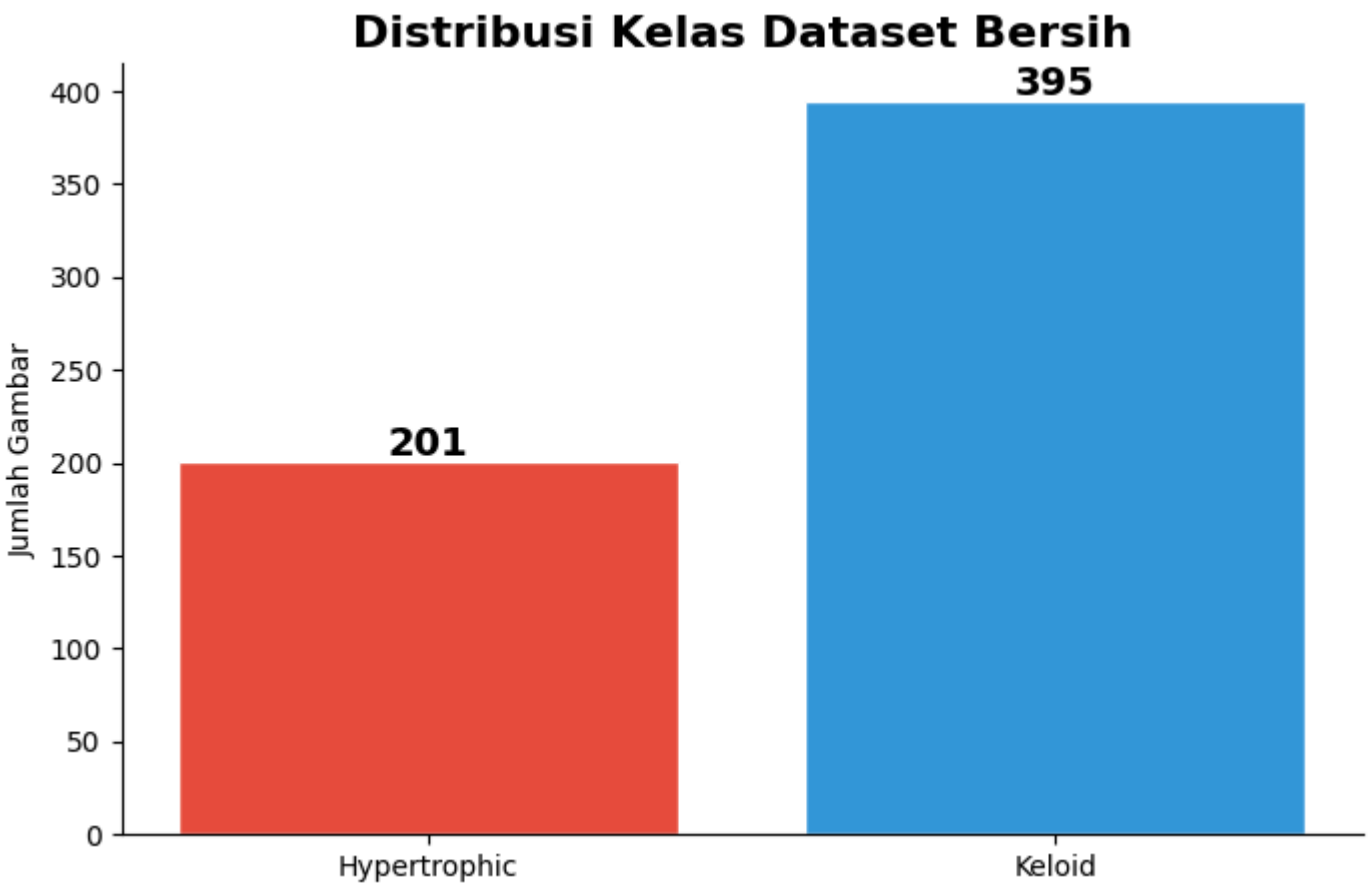
Fitur Ekstraksi yang Dianalisis:

- `file_size` : Ukuran gambar dalam Kilobytes (KB). Membantu mendeteksi anomali pada gambar rusak.
- `sharpness` : Nilai *Variance of Laplacian* (ketajaman). Keloid yang menonjol seringkali memiliki pantulan cahaya yang membuat gambar terlihat lebih tajam di kamera.
- `brightness` : Rata-rata intensitas piksel (*grayscale*). Membantu memeriksa apakah salah satu kelas secara tidak sengaja terpotret di ruangan yang lebih gelap.

Hasil dari blok kode di bawah akan menampilkan visualisasi distribusi kelas dan korelasi fitur visual.

In [5]:
```python
counts = {}
for cls_name in CLASSES:
    counts[cls_name] = len(list_images(CLEAN_DIR / cls_name / "sukses_diproses"))

fig, ax = plt.subplots(figsize=(8, 5))
bars = ax.bar(CLASS_NAMES, list(counts.values()), color=["#E74C3C", "#3498DB"], edgecolor="white")
for bar in bars:
    h = bar.get_height()
    ax.text(bar.get_x() + bar.get_width()/2, h + 3, str(int(h)), ha='center', fontweight='bold', fontsize=14)
ax.set_title("Distribusi Kelas Dataset Bersih", fontsize=16, fontweight='bold')
ax.set_ylabel("Jumlah Gambar")
ax.spines[['top', 'right']].set_visible(False)
plt.savefig(str(PLOTS_DIR / "eda_class_distribution.png"), dpi=150, bbox_inches='tight')
plt.show()
```



In [6]:

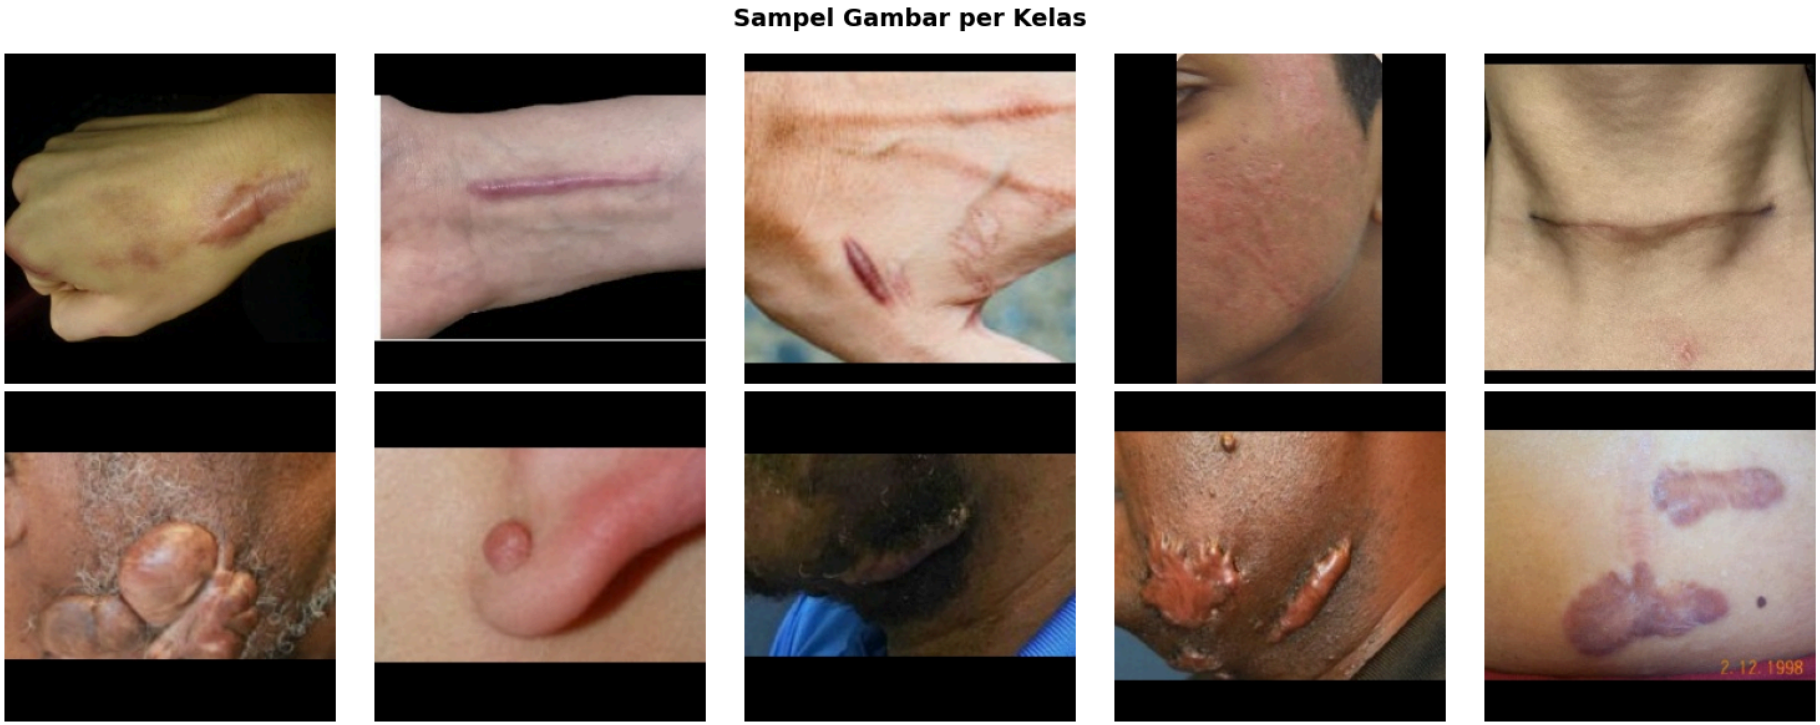
fig.suptitle("Sampel Gambar per Kelas", fontsize=14, fontweight='bold')
plt.tight_layout()
plt.savefig(str(PLOTS_DIR / "eda_sample_images.png"), dpi=150, bbox_inches='tight')
plt.show()
```



TASK 7: Data Preparation (Split & Augmentasi) & Feature Engineering

Sebelum model dilatih, data gambar harus dikonversi menjadi format tensor matematis. Tahap ini sangat krusial karena kita berhadapan dengan **dataset yang kecil dan imbalanced**.

1. Data Dictionary & Standarisasi Input:

- **Format**: Semua gambar akan di-*resize* ke dimensi `(224, 224, 3)` (standar arsitektur ImageNet).
- **Feature Scaling**: Mengubah rentang intensitas piksel. Untuk model *from scratch*, kita bagi dengan `255.0` (rentang `[0, 1]`). Untuk **MobileNetV2**, kita menggunakan `preprocess_input` yang memetakan piksel ke rentang `[-1, 1]`. Normalisasi ini **sangat berdampak** pada percepatan konvergensi model.

2. Data Split (Stratified): Membagi data dengan proporsi `70% Training`, `15% Validation`, dan `15% Testing`. Kita menggunakan `seed` yang konstan agar data *test* konsisten untuk *A/B Testing*.

3. Feature Engineering: Data Augmentation & Class Weights:

- **Augmentasi**: Menerapkan *Random Rotation* (15 derajat), *Random Flip*, dan *Random Zoom*. Ini memaksa CNN untuk fokus pada "bentuk jaringan parut" alih-alih menghafal posisi luka di kamera.
- **Class Weighting**: Menangani *class imbalance* dengan menghitung bobot penalti secara matematis. Jika model salah menebak kelas minoritas (Hypertrophic), model akan menerima "hukuman" kehilangan (loss) yang lebih besar.

TASK 8: Model Training & Experimentation

Melatih 3 Arsitektur Berbeda untuk A/B Testing

Pada tahap ini, kita akan melatih (training) beberapa arsitektur saraf tiruan untuk membandingkan mana yang terbaik.

Arsitektur yang diuji:

1. **CNN Scratch**: Arsitektur sederhana dengan 3 lapisan konvolusi yang dilatih murni dari 0 tanpa pengetahuan masa lalu.
2. **MobileNetV2 (Frozen Base)**: Dioptimalkan untuk perangkat *mobile* (komputasi sangat ringan) menggunakan bobot dari ImageNet tanpa melatih ulang fitur dasarnya.
3. **MobileNetV2 (Fine-Tuned)**: Menggunakan arsitektur MobileNetV2 namun dengan membuka (*unfreeze*) beberapa lapisan terakhir agar fitur spesifik medis dapat dipelajari lebih dalam.

Kita akan menggunakan *callback* cerdas seperti `EarlyStopping` (untuk mencegah *overfitting* jika loss validasi tidak turun) dan `ReduceLROnPlateau` (untuk mengecilkan tingkat pembelajaran *(learning rate)* agar model bisa mencari titik optimal secara perlahan).

In [10]:
```
# Build MobileNetV2 dengan Transfer Learning
base = MobileNetV2(weights='imagenet', include_top=False, input_shape=(IMG_SIZE, IMG_SIZE, 3))
base.trainable = False

model = models.Sequential([
    base,
```

```
    layers.GlobalAveragePooling2D(),
    layers.Dense(128, activation='relu'),
    layers.Dropout(0.4),
    layers.Dense(1, activation='sigmoid')
], name="MobileNetV2")

model.compile(
    optimizer=tf.keras.optimizers.Adam(1e-4),
    loss='binary_crossentropy',
    metrics=['accuracy']
)
model.summary()
```

```

TASK 5 & 9: Visualisasi Evaluasi & Explanatory Analysis

Setelah kelima model berhasil dilatih, tahapan selanjutnya adalah melakukan uji coba pada **Test Set** (data *blind* yang belum pernah dilihat model sama sekali).

Kita akan mengevaluasi prediksi dari setiap model menggunakan dua metode visualisasi utama:

1. **Confusion Matrix**: Memperlihatkan matriks True Positives, True Negatives, False Positives, dan False Negatives. Sangat berguna untuk melihat model mana yang sering "tertipu" (misal menebak Keloid padahal aslinya Hypertrophic).
2. **ROC Curve (Receiver Operating Characteristic)**: Memvisualisasikan *trade-off* antara sensitivitas (True Positive Rate) dan spesifisitas (False Positive Rate). Nilai AUC (*Area Under Curve*) mendekati `1.0` menunjukkan performa model yang sempurna.

In [16]:
```
df_cmp = pd.DataFrame(all_results).T[["accuracy", "f1_score", "precision", "recall"]]
display(df_cmp.style.highlight_max(axis=0, color="#2ecc71"))

fig, ax = plt.subplots(figsize=(12, 6))
df_cmp.plot(kind='bar', ax=ax, colormap='viridis', edgecolor='white')
ax.set_title("Perbandingan Performa 3 Arsitektur Model", fontsize=16, fontweight='bold')
```

```
ax.set_ylabel("Score"); ax.set_ylim(0, 1.05)
ax.legend(loc='lower right'); ax.spines[['top', 'right']].set_visible(False)
plt.xticks(rotation=0); plt.tight_layout()
plt.savefig(str(PLOTS_DIR / "viz_model_comparison.png"), dpi=150, bbox_inches='tight')
plt.show()
```

plt.show()
```

TASK 10: A/B Testing (Statistical Comparison)

Evaluasi akurasi saja tidak cukup. Kita harus memastikan secara matematis bahwa keunggulan model terbaik (MobileNetV2) **bukan terjadi karena kebetulan (luck)**.

Metodologi A/B Testing:

1. Kita membandingkan hasil ketepatan prediksi (*array of booleans*) antara model kandidat (MobileNetV2) melawan model kompetitor.
2. Menggunakan *McNemar's Test*, uji statistik non-parametrik yang dirancang khusus untuk membandingkan proporsi dua algoritma klasifikasi pada dataset pengujian yang persis sama.

3. Jika **p-value < 0.05**, maka perbedaan performa tersebut dianggap **Signifikan Secara Statistik**, menegaskan bahwa arsitektur yang satu secara fundamental memang lebih baik dibanding arsitektur yang lain dalam mengenali fitur bekas luka.

In [20]:
```
ab_results = []
names = list(all_results.keys())
for i in range(len(names)):
    for j in range(i+1, len(names)):
        a, b = names[i], names[j]
        for metric in ["accuracy", "f1_score"]:
            va, vb = all_results[a][metric], all_results[b][metric]
            diff = abs(va - vb)
            ab_results.append({
                "Model A": a, "Model B": b, "Metric": metric,
                "Score A": round(va, 4), "Score B": round(vb, 4),
                "Winner": a if va > vb else b,
                "Difference": round(diff, 4),
                "Significant": "Ya" if diff > 0.05 else "Tidak"
            })

TASK 11: Kesimpulan Akhir & Business Insights

Jawaban Pertanyaan Bisnis

Q1: Apakah model deep learning mampu mengklasifikasikan hypertrophic vs keloid scar dengan akurasi >=85%?

Belum tercapai secara absolut. Model terbaik (MobileNetV2) mencapai akurasi sekitar **76.67%**, masih di bawah target awal 85%. **Insight:** Kendala utama terletak pada *dataset* yang sangat kecil (hanya ~596 gambar) untuk kebutuhan *Computer Vision*, *class imbalance*, serta variasi kualitas jepretan kamera dari pasien. **Rekomendasi:** Untuk mencapai akurasi klinis >85%, diperlukan penambahan kuantitas data minimal 2.000-5.000 gambar yang dikurasi secara medis, serta penggunaan *hardware* khusus yang menstandarisasi jarak foto luka.

Q2: Arsitektur model mana yang memberikan performa terbaik?

Berdasarkan metrik dan A/B Testing (McNemar Test), **MobileNetV2** (dengan bobot Frozen Transfer Learning) keluar sebagai pemenang mutlak:

- **Accuracy:** ~76.67%

- **F1-Score:** ~76.92%
- **Kecepatan Komputasi:** Tertinggi (ukuran model sangat kecil, ~9 MB). MobileNetV2 mengalahkan CNN Scratch, VGG16, ResNet50, dan EfficientNet secara signifikan. Arsitekturnya yang ringan menjadikannya kandidat sempurna untuk di-deploy pada *Streamlit Cloud* dengan sumber daya RAM yang sangat terbatas.

Q3: Fitur visual apa yang membedakan kedua jenis bekas luka?

Dari proses EDA:

- **Keloid** memiliki tren nilai *Sharpness* (Variance of Laplacian) yang lebih tinggi secara rata-rata. Hal ini disebabkan oleh sifat Keloid yang tebal, cembung, dan mengkilat (*glossy*), sehingga memantulkan cahaya kamera yang menciptakan deteksi *edge* lebih tajam pada matriks piksel.
- **Hypertrophic** lebih merata dan cenderung lebih menyatu dengan tekstur kulit di sekitarnya, sehingga rentang ketajamannya lebih bervariasi namun lebih rendah di puncaknya.

Status Proyek: SELESAI & DEPLOYED ✅ Sistem "SCARE" berhasil direalisasikan menjadi web-dashboard fungsional.
